Lab 1-

Programming in RISCV assembly

Objective

Credits: startup lab for compilation courses in Lyon and Valence, in collaboration with Matthieu Moy.

- Be familiar with the RISCV instruction set.
- Understand how it executes on the RISCV processor with the help of a simulator.
- Write simple programs, assemble, execute.
- Pair working only. (not more) Chamilo deposit exercise number XXX : see Chamilo for instructions.

1.1 Startup: assembling, desassembling, simulating

<u>EXERCISE #1</u> ► Lab preparation Boot on Linux !. Get the archive on chamilo, then extract:

tar xvzf archivename.tgz

On the Esisar (linux) machines, everything is already installed. If you want to install on your machines, follow the instructions on this webpage (but not during a lab session!)

https://forge.univ-lyon1.fr/matthieu.moy/mif08-2021/-/blob/main/INSTALL.md

<u>EXERCISE #2</u> ► RISCV C-compiler and simulator, first test In the directory TP01/startup/:

- Compile the provided file ex1.c with: riscv64-unknown-elf-gcc ex1.c -o ex1.riscv It produces a RISCV binary named ex1.riscv.
 Execute the binary with the RISCV simulator:
 - spike pk ex1.riscv This should print: bbl loader

42

If you get a runtime exception, try running spike -m100 pk ex1.riscv instead: this limits the RAM usage of spike to 100 MB (the default is 2 GB).

- The corresponding RISCV code can be obtained in a more readable format by: riscv64-unknown-elf-gcc ex1.c -S -o ex1.s -fverbose-asm (have a look at the generated .s file!)
- EXERCISE #3 ► Documents

Some documentation can be found in the RISCV ISA on Chamilo.

1.1.1 Assembling, disassembling

```
<u>EXERCISE #4</u> \blacktriangleright Hand assembling, simulation of the hex code Assemble by hand (on paper) the instructions:
```

```
    .globl main

    main:

    addi a0, a0, 1

    bne a0, a0, main

    end:

    ret
```

You will need the set of instructions of the RISCV machine and their associated opcode. All the info is in the (mini) ISA documentation.

To check your solution (after you did the job manually), you can redo the assembly using the toolchain:

riscv64-unknown-elf-as -march=rv64g asshand.s -o asshand.o

asshand.o is an ELF file which contains both the compiled code and some metadata (you can try hexdump asshand.o to view its content, but it's rather large and unreadable). The tool objdump allows extracting the code section from the executable, and show the binary code next to its disassembled version:

```
riscv64-unknown-elf-objdump -d asshand.o
```

Check that the output is consistent with what you found manually.

From now on, we are going to write programs using an easier approach. We are going to write instructions using the RISCV assembly.

1.1.2 RISCV Simulator

Code source is again in directory TP01/startup

<u>EXERCISE #5</u> ► Execution and debugging

See https://www.lowrisc.org/docs/tagged-memory-v0.1/spike/ for details on the Spike simulator.

test_print.s is a small but complete example using Risc-V assembly. It uses the println_string, print_int, print_char and newline functions provided to you in libprint.s. Each function can be called with call print_... and prints the content of register a0 (call newline takes no input and prints a newline character).

- First test assembling and simulation on the file test_print.s: riscv64-unknown-elf-as -march=rv64g test_print.s -o test_print.o
- 2. The libprint.s library must be assembled too: riscv64-unknown-elf-as -march=rv64g libprint.s -o libprint.o
- 3. We now link these files together to get an executable 1 :

riscv64-unknown-elf-gcc test_print.o libprint.o -o test_print The generated test_print file should be executable, but since it uses the Risc-V ISA, we can't execute it natively (try ./test_print, you'll get an error like Exec format error).

4. Run the simulator:

```
spike pk ./test_print
The output should look like:
bbl loader
HI CE313
42
```

а

The first line comes from the simulator itself, the next two come from the println_string, print_int and print_char calls in the assembly code.

- 5. We can also view the instructions while they are executed:
- spike -1 pk ./test_print

Unfortunately, this shows all the instructions in pk (Proxy Kernel, a kind of mini operating system), and is mostly unusable. Alternatively, we can run a step-by-step simulation starting from a given symbol. To run the instructions in main, we first get the address of main in the executable:

\$ riscv64-unknown-elf-nm test_print | grep main

000000000001014c T main

This means: main is a symbol defined in the .text section (T in the middle column), it is global (capital T), and its address is 1014c (you may not have the same address, so **write somewhere yours**). Now, run spike in debug mode (-d) and execute code up to this address (until $pc \ 0 \ 1014c$, i.e. "Until the program counter of core 0 reaches 1014c"). Press **Return** to move to the next instruction and q to quit:

¹you can use any name, and/or add an extension such that .exe or .riscv for your binaries, we do not mind

```
$ spike -d pk ./test_print
: until pc 0 1014c
bbl loader
       0: 0x00000000001014c (0xff010113) addi
core
                                                  sp, sp, -16
       0: 0x000000000010150 (0x00113423) sd
                                                  ra, 8(sp)
core
       0: 0x000000000010154 (0x0000e517) auipc
core
                                                  a0, 0xe
       0: 0x000000000010158 (0x41450513) addi
core
                                                  a0, a0, 1044
: q
$
```

Remark: You may want to assemble and link with a single command (which can also do the compilation if you provide . c files on the command-line):

riscv64-unknown-elf-gcc -march=rv64g libprint.s test_print.s -o main

In real-life, people run compilation+assembly and link as two different commands, but use a build system like a Makefile to re-run only the right commands.

1.2 Let us program!

Source code is now in TP01/riscv.

1.2.1 Simple programs to complete

<u>EXERCISE #6</u> ► MinMax

During the course, we wrote a program minmax that computes the maximum of two 64 bits integers in memory.

- Verify that it actually works (perhaps add some print_int calls).
- Extend this program so that it also computes the minimum. Test.

<u>EXERCISE #7</u> \blacktriangleright Array sum

In the exercice session we wrote a routine to increment each element of an array by a constant 1. A solution is given in arrayinc.s.

- Read, understand, test this program.
- Copy the source into a new file:
 - cp arrayinc.s arraysum.s
- Edit the new file and modify so that it computes the sum of all elements of the array.

EXERCISE #8 ► Palindromes

Inspired by http://home.wlu.edu/~lambertk/classes/210/exercises/hw7.htm.

A given string is a palindrome if it is equal to its mirror string. For instance *kayak* and *noon* are palindroms. In pseudo-C, the following pseudo-code actually computes whether a given word is palindromic:

```
bool isPalindrome(char *string){
    int left,right ;
    left = 0 ;
    right = len(string) - 1 ;
    while (left < right){
        if (string[left] != string[right])
            return(false);
        left += 1;
        right -= 1;
    }
    return(true)
}</pre>
```

The objective is to write the equivalent in RISCV assembly. We give you a squeleton of code in TP01/riscv/ispal.s. A length routine is given.

- Test the length routine (call from the main).
- Complete the ispal routine, and test.
- Explain why storing ra on the stack is mandatory, for which routine ?

1.2.2 Programs "from scratch"

EXERCISE **#9** ► Integer sum

n being stored in memory, write a program that computes the sum 1 + 2 + ... + n, and prints the result.

<u>EXERCISE #10</u> \blacktriangleright Caesar code

(Only) This exercise will be evaluated. Instructions on Chamilo.

Create a file named codecesar.s, starting with:

```
# Code de César en RISCV
# CE313, binôme : NOM1, NOM2
.section .text
.globl main
main:
addi sp,sp,-16
sd ra,8(sp)
...
```

A chain *s* being stored in memory, as well as a *dec* number, compute the Caesar code of the chain: shift every letter value by dec.

Your code should print the input string and the encoded one (thanks to a call to print_string. For instance, with the Hello World chain and a dec equal to 4:

Hello world! Lipps\${svph%
